Abstract of DE3816408

In the case of a dishwashing machine, individual spray elements (5) which can be connected to a circulating pump (26) via a changeover device (22) are situated within a washing container (1). In order to achieve, with minimized water consumption, adaptation of the rinsing action exerted on the dishes to be cleaned, for example as a function of the loading, the spray elements (5) can be connected in free succession to the circulating pump (26) via the changeover device (22).
